Looping Structure

LEARNING OBJECTIVES

- To understand the importance of Looping Structure
- To know different types of Looping Structure in PHP
- To know the Basic fundamental logic creation using Looping Structure

Looping Structure:

Loop structures in PHP is an iterative control structures that involves executive the same block of code a specified num ber of times. Loops that iterate for fixed no of times is also called as Bounded loops. PHP supports four types of loops. Refer Figure 7.1 for flow chart of for Loop Structure.

- for Loop
- foreach Loop
- While Loop
- Do While Loop

For Loop:

The for loop is used when you know how many times you want to execute a statement or block of statements.

Syntax:

```
for (init counter; test counter; increment counter) {
   code to be executed;
}
```

Parameters:

- init counter: Initialize the loop initial counter value
- Test counter: Evaluated for every iteration of the loop. If it evaluates to TRUE, the loop continues. If it evaluates to FALSE, the loop ends.
- Increment counter: Increases the loop counter value.
