Country top-level domain names

Country domain uses 2-character country abbreviation according to country. For e.g., google.in – for INDIA, google.us for US. Refer Table 12.2

Table 12.2 Country domain names

Domain Name	Meaning
in	India
us	United States
fr	France
uk	United Kingdom
ca	Canada
au	Australia
lk	Srilanka
bd	Bangladesh
cn	China
pk	Pakistan
jp	Japan
sg	Singapore

Domain names may also be used in other than English languages in UNICODE format. Tamil language is also used in three country Top Level Domain names which are. இந்தியா,.சிங்கப்பூர் and .இலங்கை

Domain Name	Meaning
இந்தியா	India
சிங்கப்பூர்	Singapore
இலங்கை	Srilanka

12.5.2 Name Server

The information which needs to be stored in Domain name space is quite large. Single system would be inefficient and insufficient to store such a huge amount as responding to requests from all over the world. It also becomes unreliable because in case of any failure the data becomes inaccessible.

The solution to this problem is to distribute the information among many computers. The best way to do that is to divide the entire space into many domains and sub domains. DNS also allows domains to be further divided into sub domains. By this, the solution to the problem is obtained and hierarchy of servers is also maintained. Name servers store the data and provide it to clients when queried by them. Name Servers are programs that run on a physical system and store all the zone data.

Inverse domain performs the opposite task of normal DNS query. It converts the IP address to domain name.

Name Server is a main part in the Domain Name System (DNS). It translate the domain names to IP addresses. Name server contains the DNS database which consists of domain names and their corresponding IP addresses. There is a need to store large number of domain names for the world wide usage, so plenty of servers are used in the hierarchical manner. Name servers do the important task of searching the domain names. While you searching a website, Local Name server (provided by ISP) ask the different name servers until one of them find out your answer. At last it returns IP address for that domain name. Your computer can now connect to the requested webpage stored on the webserver. Refer Figure 12.8
