5. In this position of pin no. 5 describes that it is not connected or bidirectional and the color is white blue.
6. In this position of pin no. 6 describes the receive data or bidirectional with the RX (Negative) which has a negative terminal and the color used in this position is orange.
7. In this position of pin no. 7 describes that it is not connected or bidirectional and the color is white brown.
8. In this position of pin no. 8 describes that it is not connected or bidirectional and the color is brown.

13.3.3 Ethernet card and Port

Ethernet card is a Network Interface Card (NIC) that allows computers to connect and transmit data to the devices on the network. It may be an expansion card or built-in type. Expansion card is a separate circuit board also called as PCI Ethernet card which is inserted into PCI slot on motherboard of a computer. Now a days most of the computers come with built-in Ethernet cards which resides on motherboard. Wireless Ethernet cards are also available, which uses radio waves to transmit data. See Figure 13.12

Ethernet port is an opening which is a part of an Ethernet card. It accepts RJ45 connector with Ethernet cable. It is also called as RJ45 jack. It is found on personal computers, laptops, routers, switches, hubs and modems. We can see an Ethernet port on the back side of a computer or a laptop. It connects Ethernet cable with Ethernet card mounted on motherboard.

These days, most of the computers and laptops have a built-in Ethernet port for connecting the device to a wired network. Some of them not having an Ethernet port use an Ethernet dongles to form a network with other devices. Devices or computers which use wifi only for networking eliminates both the cable and its port. See Figure 13.13

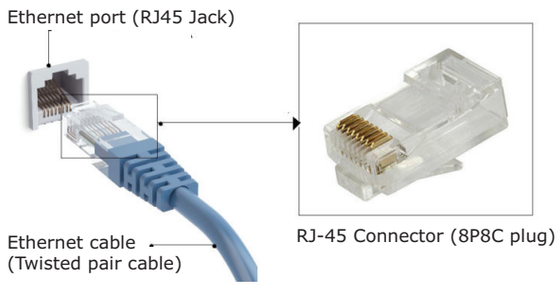

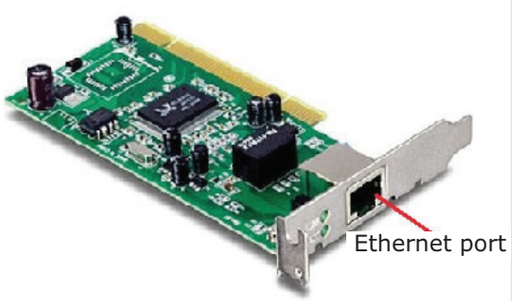

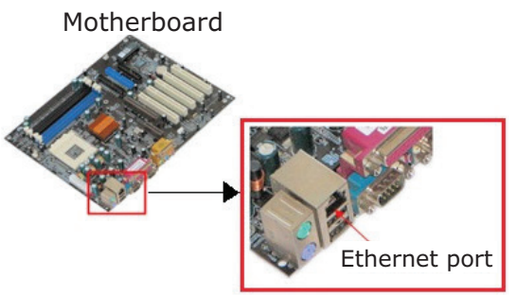

Figure 13.13 Ethernet cable with Port

Once you inject the plug into the port the two led lights will glow in the computer, one is green and another one is orange. The orange light will start blinking which indicates that the Internet is connected.
