its recipient integrity claims. Therefore, the recipient can strongly insist on the signature of the sender so as not to be easily denied at a later time.

- The difference between a digital signature and digital certificate is that a digital certificate binds a digital signature to an entity; whereas a digital signature ensures that a data remain secure from the point it was sent. In other words: digital certificates are used to verify the trustworthiness of the sender, while digital signatures are used to verify the trustworthiness of the data being sent.
- The certificate authority maintains a database of public keys called repository so that it can verify the user with digital signatures. Expired certificates are usually deleted from the database by the certificate authority.
- Brute-force attacks is the simplest attack method for breaking any encryption; that is, trying all the possible keys one by one.

GLOSSARY

3-D Secure	An additional security layer for online credit and debit card transactions.
Ciphertext	It is the encrypted data usually the output of an encryption algorithm
Cracker	A person who breaks computer network's security maliciously to gain access to critical data.
Cryptanalysis	Analyzing a suspecting document for hidden data or chiphertext
Cyber Squatting	Is the illegal practice of registering an Internet domain name that might be wanted by another person in an intention to sell it later for a profit
Decipher	A standard algorithm for decrypting data
Domain name	The website address of an online store, e.g.www.amazon.com
Encryption	A method of scrambling data using an algorithm to protect / hide from unauthorized access.
Friendly Fraud	Is an intentional falsely claim of a costumer that they really didn't buy(after receiving the goods)
Hacking	Unauthorized intrusion into a computer or a network. That is to say breaking security to gain access to a website illegally and intercept confidential information
Message digest (MD)	Is a representation of data in a form of single string of digits using one-way hashing formula.
One-Time Password (OTP)	A dynamic password that is valid for one login session or transaction provides a potential security for a e-payment transaction.
PIN (Personal Identification Number)	A static number that is assigned to consumers to secure card based payments.
Plaintext/ cleartext	It is the unencrypted information also called as input chip
Traffic	An indicator that marks the number of visitors for a particular site.
