

Figure: 3.13 Most Popular databases - Statistics

supported by Light databases. Below are the lists of commonly used databases.

- DB2
- MySQL
- Oracle
- PostgreSQL
- SQLite
- SQL Server
- Sybase

Due to the rapid growth in the web domain, most of the desktop applications are being converted into web applications. These transformations to the web results in the availability of many web applications in the network. Heavy databases did not meet out the network issues efficiently. Light databases were able to handle all the issues raised by the network. So all the light databases that supports the web applications are also known as Web Databases. See Figure 3.13

MySQL is the most commonly used database in the world due to its ease of use.

3.8 MySQL - Administration

3.8.1 MySQL – Administration Responsibilities

In general there exists a role known as Database Administrators (DBA's) who takes care of configuration, installation, performance, security and data backup. DBA's posses the skills on database design, database queries, RDMS, SQL and networking. The primary task is the creation of new user and providing them with access rights.

Creating New User Account to MySQL

In **MySQL** database, there exists a table named **user**. The newly created account must have an entry in this **user** table. Consider the admin creates an account with username and password. The user account is activated with various access rights like INSERT, SELECT and UPDATE. Consider the **user** table has the following fields host, name, password, select_priv, insert_priv and update_priv.
