Syntax2: select * from tablename ORDER BY columnname DESC;

Example: select * from Biodata ORDER BY firstname DESC;

Table:3.24 Select Record List

firstname	lastname	age
Sugal	S	14
Krishna	S	13
Arun	J	15

Grouping Records, Having Clause

In SQL we can have identical data in a group. Consider a table named Exams with fields Rollno, Subject and Marks. In the below table multiple rows of records are available for different subjects. Using the GROUP BY command, the rollno's are grouped and marks are added up against the Rollno with SUM(marks). See Table 3.25 and 3.26.

Table:3.25 Select Record List

Rollno	Subject	Marks
201901	Tamil	81
201904	English	75
201901	English	96
201903	Tamil	92
201902	Tamil	78
201904	Tamil	83
201903	English	81
201905	Tamil	89
201902	English	80
201905	English	90

Example: Select Rollno, SUM(Marks) from Exams GROUP BY Rollno;

Table:3.26 Select Record List

Rollno	Marks
201901	177
201902	158
201903	173
201904	158
201905	179

Joining Tables

When we have to select data from more than 2 tables SQL JOIN clause is used. Consider two tables Exams and Profile. The Exams table has the fields Rollno, Subject and Marks. The data of **Profile** table is shown below in Table 3.27 & 3.28.

Table: 3.27 Select JOIN Record List

Rollno	Name	Hobby
201901	Krishna	Gardening
201902	Sugal	Photography
201903	Charles	Reading
201904	Venilla	Singing
201905	Pragathi	Painting

Example: SELECT Profile.Name, Profile. Hobby, SUM(Exams.Marks)As Total

FROM Profile, Exams

WHERE Profile.Rollno = Exams.Rollno

GROUP BY Profile.Name, Profile.Hobby;
