and general purpose scripting language invented by Rasmus Lerdorf in 1994. It is very simple and lightweight open source server side scripting language. It can easily embed with HTML and other client side scripting languages like CSS (Cascading Style Sheets) and Java script. It also creates dynamic and interactive Webpages in the real time Web development projects.

It is a competitor and alternative for other server side scripting languages like Microsoft ASP (Active Server Page) and JSP (Java Server page). Recent statistics of server side scripting language usage depict that 78.9 % of Website are developed by PHP scripting language.

4.2 Various Server-side Programming Languages Global Usage Statistics

PHP scripting language can be executed via an interpreter which is installed in the Webservers or CGI (Common Gateway Interface). Most of the Webservers such as Apache Tomcat, Microsoft IIS (Internet Information server) supports the PHP interpreter module. Refer Figure 4.1

PHP is an open source community development initiation. It has many versions to ensure quality and ease of Web development activities. The current version of PHP, 7.3 is released by the official team on 30 November 2017.

4.3 Client Server Architecture

In the evolution of network architecture, various critical networks related problems are getting resolved by client server architecture model. The client server architecture introduces application sharing mechanism between two different hardware systems over the network (Internet/intranet). In 1990's Internet was emerging in the computer network field. The main objective of Internet implies that an application is shared by more than one hardware either it could be a server or client machine.

The server is a high performance hardware machine which can run more than one application concurrently. The client is a separate hardware machine which is connected with server in the network (Internet/intranet). It could send the request and receive the response from the server hardware. The Server and client are also called as service provider and service requester respectively.
