

Solid grinding wheels

Segmented grinding wheels

Mounted grinding wheels

According to construction, grinding wheels are classified as follows.

1. Solid grinding wheels
2. Segmented grinding wheels
3. Mounted grinding wheels

4.10 Abrasive

Abrasives are used for grinding and polishing operations. It should be pure and have uniform physical properties of hardness, toughness and resistance to fracture. They are two types of abrasives

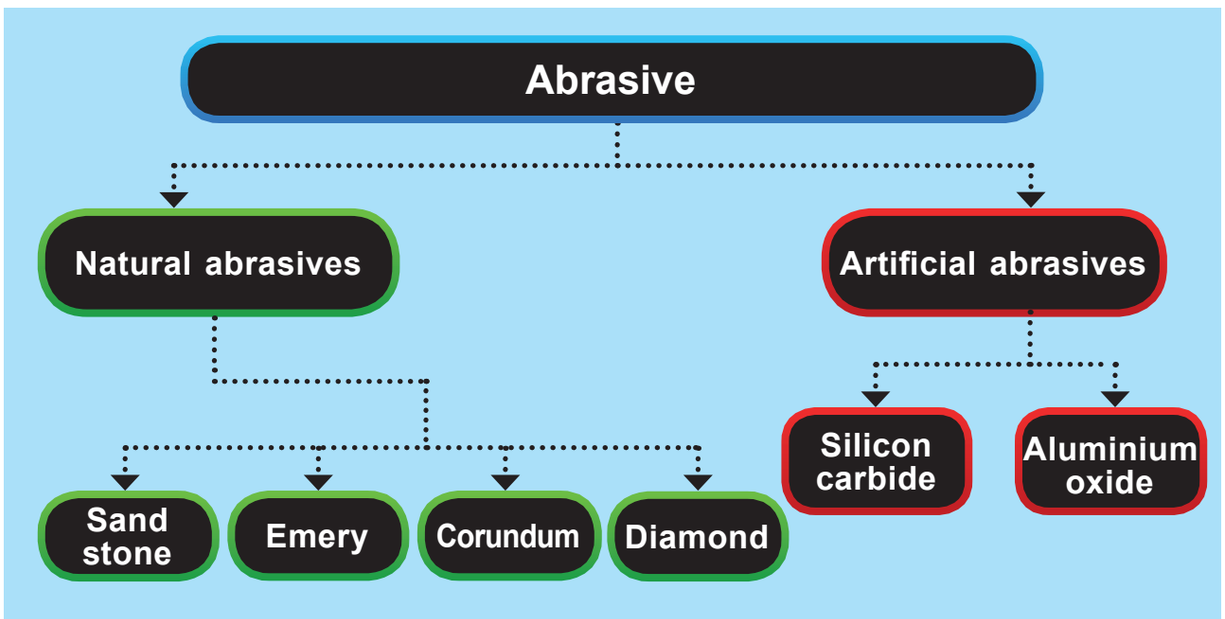

1. Natural abrasives
2. Artificial abrasives

Natural Abrasives

The natural abrasives are obtained from the Earth's crust. They include sand stone, emery, corundum and diamond.

Sandstone is used as abrasive to grind softer materials only. Emery is a natural aluminium oxide. It contains aluminium oxide, iron oxide and other impurities. Corundum is also a natural aluminium oxide. Emery and corundum have a greater hardness and better abrasive action than sandstone.

Diamond is the hardest natural abrasive. It is used in making grinding wheels to grain cemented carbide tools.
