from 0.75 mm to 7 mm. The side of the cutter is relieved so that side may not rub against the work.

Metal slitting saw

Angle milling cutters

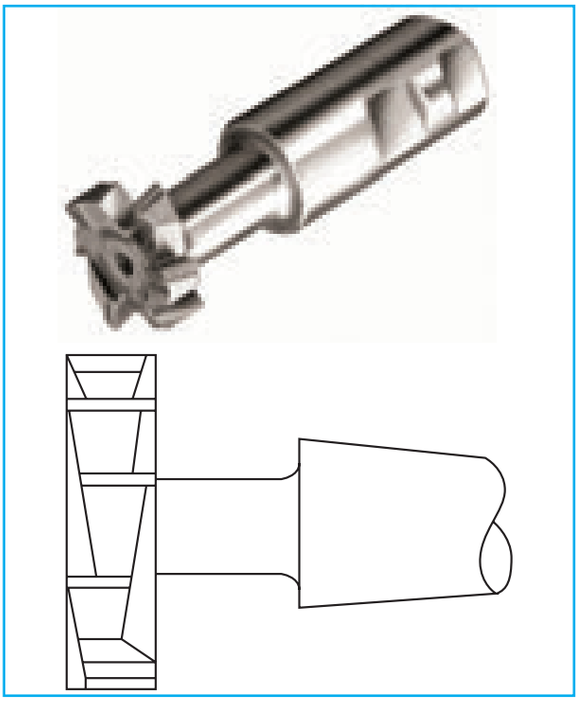

The teeth of the angle milling cutter are not parallel to the axis but are at an angle to it. By using angle milling cutter, inclined surfaces, bevels and helical grooves are machined. There are two types of angle milling cutter single angle milling cutters and double angle milling cutter.

'T' – Slot milling cutter

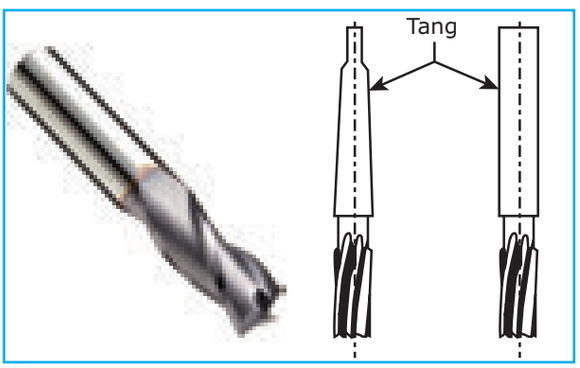

It is a special form of end mills intended for machining 'T' slots. It looks like a side milling cutter with a shank. The cutters have cutting teeth on the periphery as well as on both sides of the cutter.

End mill Cutter

These cutters have cutting teeth on the end as well as on the periphery of the cutter. It is made of two parts – body and shank. The shanks of the cutter may be straight or taper. If the cutter doesn't have a shank it is called shell end milling cutter. These cutters are useful in machining long narrow slots, holes and flat surface.

End milling cutters

Flying cutter

Flying cutter is the simplest form of cutter. It consists of a single point cutting tool attached to the end of the arbor. The cutting edge may be formed to reproduce a contoured surface. They are used when standard cutters are not
