3. Metal spinning lathes are useful in making tumblers and vessels from sheet metal.
4. Polishing of vessels is carried out in polishing lathe.

Bench lathe

Bench lathe is a small lathe generally mounted on a bench. It consists of all the parts of an engine lathe. It is used for small works like machining tiny and precise parts and parts of measuring instruments.

Tool room lathe

A tool room lathe has similar features of an engine lathe but is accurately built and has wide range of spindle speeds to perform precise operations and different feeds. It is costlier than a centre lathe. This is mainly used for precision works like manufacturing tools, dies, jigs, fixtures and gauges.

Semi Automatic lathe

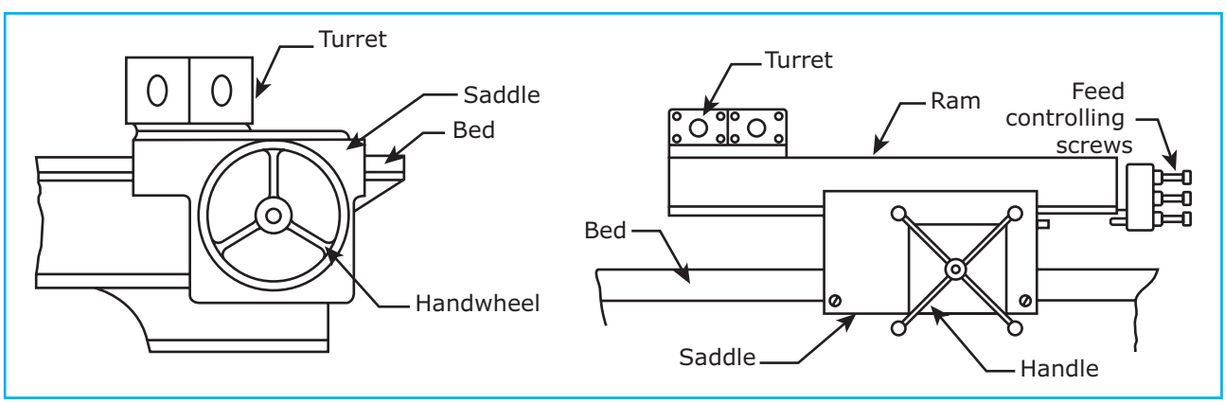

Turret and capstan lathes are known as semi-automatic lathes. These lathes are used for production work where large quantities of identical work pieces are manufactured. They are called semi-automatic lathes as some of the tasks are performed by the operators and the rest by the machines themselves.

There are two way tool posts in the machine namely four way tool post and rear tool post. Four tools can be mounted on the four way post and parting tool is mounted on the rear tool post. The tailstock of an engine lathe is replaced by a hexagonal turret. As many tools may be fitted on the size side of the turret, different types of operations can be performed on a workpiece without resetting of tools.

Advantages

1. Machining operations can be done in this machine by semi skilled operators.
2. Large quantity of product can be produced quickly.
3. The cost of production is less.

The tool heads of a turret lathe and a capstan lathe are illustrated in figure.
