Drill Jig

Drill jigs are used for holding the work in mass production process. A jig is specially designed to hold the work securely and to guide the tool at any desired position. Holes may be drilled at the same relative positions on each of the identical work pieces.

Drill Jig

The work is clamped and removed easily. The cost of making a drill jig is more but a low order of skill is sufficient to work with a drill jig.

The following different types of jigs are used to hold the work pieces in drilling machine.

1. Pate Jig
2. Channel Jig
3. Diameter Jig
4. Box Jig
5. Indexing Jig

2.15 Tools used in a drilling machine

The following tools are used for performing different types of operations in a drilling machine. They are

1. Drill
2. Reamer
3. Counter bore
4. Counter sink
5. Tap

Drill

A drill is a tool used to originate a hole in a solid material. A helical groove known as 'flute' is cut along the length of the drill.

Drill Bit

Different types of drills are,

1. Flat drill
2. Straight fluted drill
3. Twist drill
4. Centre drill

Twist drills are generally used in shop work. They are made of High speed steel (HSS), (or) High Carbon Steel (HCS).

There are two types of drills namely

1. Straight shank twist drill
2. Taper shank twist drill
