Reamer

The tool used for enlarging and finishing a previously drilled hole is known as a reamer. It is a multi tooth cutter and removes smaller amount of material. It gives a better finish and accurate dimension.

Counter bore

A counter bore is a multi tooth cutting tool used for enlarging the top of the previously machined hole. It has three or four cutting teeth.

The flutes on them may be straight or helical. Straight fluted tools are used for machining softer material like brass and aluminium and for short depth of cut. Helical fluted counter bores are used for longer holes.

Counter Sink

A counter sink has cutting edges on its conical surfaces. It has a similar construction of counter bore except for the angle of the cutting edges. The angle of counter sinks will generally be 60^0, 82^0 or 90^0. It is used for enlarging the top of the holes conically.
