3.12 Types of shaper tools

The material of the cutting tool used in a shaping machine should have more hardness and temper when compared to the material of the workpiece. So, the shaper tools are made of the following materials.

1. High Carbon Steel
2. High Speed Steel
3. Carbide tipped tool
4. Stellite tool

Types of shaper tools

According to the type of operation, various tools are used in a shaper. They are

Right hand (R.H) tool

- This is a tool used for machining by moving the job from right to the left.

Left hand (L.H) tool

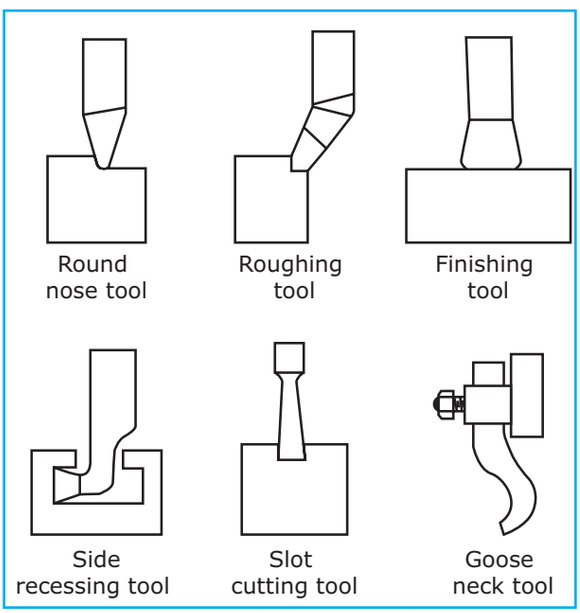

- This is a tool used for machining by moving the job from left to right.

Roughing tool

- When it is required to remove a good amount of material from the workpiece, roughing tools are used. The cutting edge will be very thick, sharp and strong to withstand the cutting pressure and to dissipate the heat generated at the cutting point. The surface obtained will be very rough.

Finishing tool

After the rough machining is performed, the finishing tool is used to obtain a very high quality of surface finish. The cutting edge will be either flat or slightly convex. Different types of shaper tools are shown in Figure.
