or physical, e.g. ground glass or metal fragments) are identified.

2. **Identify critical control points** - These are points in a food's production - from its raw state through processing and shipping to consumption by the consumer - at which the potential hazard can be controlled or eliminated. Examples are cooking, cooling, packaging, and metal detection.

3. **Establish preventive measures with critical limits for each control point** - For a cooked food, for example, this might include setting the minimum cooking temperature and time required to ensure the elimination of any harmful microbes.

4. **Establish procedures to monitor the critical control points** - Such procedures include determining how and who should monitor the cooking time and temperature.

5. **Establish corrective actions when monitoring shows that a critical limit has not been met** - For example, reprocessing or disposing of food if the minimum cooking temperature is not met.

6. **Establish procedures to verify that the system is working properly** - For example, testing time and-temperature recording devices to verify that a cooking unit is working properly.

7. **Establish effective record keeping for documentation** - This would include records of hazards and their control methods, monitoring of safety requirements and action taken to correct potential problems.

Five Keys to Safer Food*

1. Keep Clean

- Wash your hands before handling food and often during food preparation.
- Wash your hands after going to the toilet.
- Wash and sanitize all surfaces and equipment used for food preparation.
- Protect kitchen areas and food from insects, pests and other animals.

2. Separate raw and cooked food

- Separate raw meat, poultry and seafood from other foods.
- Use separate utensils such as knives and cutting boards for handling raw foods.
- Store food in containers to avoid contact between raw and prepared foods.
