Make sure you named the file with the .exs file extension! Many new Elixir developers get tripped up when they name a test file .ex and then it doesn't work.

This sets up a new ExUnit test case. The option async: true makes our tests automatically run in parallel with other test files. This massively speeds up tests across a large codebase. There are times when you wouldn't want to use async tests, but that's outside of the scope of this chapter.

Let's add a test case. We'll test our required fields, that the country code is automatically added, and that the phone number is valid.

phone_app/test/phone_app/conversations/schema/new_message_test.exs

```
Line 1  describe "changeset/1" do
        test "fields are required" do
          cs = NewMessage.changeset(%{})
        
          assert [
            to: {"can't be blank", _}, body: {"can't be blank", _}
          ] = cs.errors
        end
        
        test "the country code is added if not present" do
          assert %{
            errors: [],
            changes: %{to: "+1 5005550006"}
          } = NewMessage.changeset(%{"body" => "test", "to" => "5005550006"})
        end
        
        test "the phone number is validated" do
          assert %{
            errors: [to: {"is an invalid phone number", _}]
          } = NewMessage.changeset(%{"body" => "test", "to" => "+1 111-222-3333"})
        end
      end
```

Run mix test to see that your new tests are green. Let's break these tests down in the next section—we'll go line by line to cover how the test works.

Going Through Our Changeset Tests

We wrap everything inside of the describe/2 macro. This isn't required, but it's a best practice to group and name your tests—typically based on the function name. Each test is wrapped inside of the test/2 macro. Everything inside of a test block runs as an individual test case.

Inside of an individual test case, we have access to the same modules and functions available to our application. We don't need to do anything special to access our application's modules—ExUnit includes everything
