The top result should be the official Postgres image. Click that, and it will take you to the following information page:[1]

The really great thing about these Docker Hub repository pages is that image providers—Postgres, in this case—can, and usually do, provide detailed information on how to use the image.

I recommend sticking with Docker Official Images[2] wherever possible since these are vetted for security vulnerabilities by Docker, and they commit to applying security updates in a timely manner. Outside of these, you have no guarantees about what software an image may be running or how quickly the image is updated.

Using the Docker CLI

The other way to find images is by using the Docker CLI. For example, to find Postgres-related images, you would use the following command:

```
$ docker search postgres
```

If you run this now, you'll see output similar to the following:

```
NAME                     DESCRIPTION                 STARS  OFFICIAL  AUTOMATED
postgres                 The PostgreSQL object-r...  3828   [OK]
kiasaki/alpine-postgres  PostgreSQL docker image...  33                [OK]
nornagon/postgres                                    10                [OK]
macadmins/postgres       Postgres that accepts r...  8                 [OK]
«...»
