```
»     }
»   end
  end
```

This configures the Android app to display all forms as modals—identified by routes ending in `/new` or `/edit`. Just like the iOS app.

Unlike iOS, once the path configuration is in place, Android needs an additional rule to function correctly: a rule that matches *all* URL paths. Add the following rule above the one that already exists:

ch03_12/rails/app/controllers/configurations_controller.rb

```
  class ConfigurationsController < ApplicationController
    def ios_v1
      # ...
    end

    def android_v1
      render json: {
        settings: {},
        rules: [
»         {
»           patterns: [
»             ".*"
»           ],
»           properties: {
»           }
»         },
          {
            patterns: [
              "/new$",
              "/edit$"
            ],
            properties: {
              context: "modal"
            }
          }
        ]
      }
    end
  end
```
