This is known as the *wildcard rule* because it matches everything. Path configuration rules are applied from top to bottom, applying properties to all rules that match. So any properties assigned here will also be included in URL paths matching rules that appear later.

For this rule, set the `uri` property and enable pull-to-refresh like so:

ch03_13/rails/app/controllers/configurations_controller.rb

```
    class ConfigurationsController < ApplicationController
      def ios_v1
        # ...
      end

      def android_v1
        render json: {
          settings: {},
          rules: [
            {
              patterns: [
                ".*"
              ],
              properties: {
»               uri: "hotwire://fragment/web",
»               pull_to_refresh_enabled: true
              }
            },
            {
              # ...
            }
          ]
        }
      end
    end
```

The `uri` property ensures the default Hotwire Native `WebFragment` class is rendered for every screen. Don't worry about this just yet, as we'll explore this in detail in Chapter 6, *Render Native Screens with Jetpack Compose*.
