Enabling pull-to-refresh allows users to drag their finger down the web view to trigger a reload of the page, a common and expected action on Android apps. But this action can often conflict with dismissing screens that are presented as modals. So go ahead and disable this feature for modals.

ch03_14/rails/app/controllers/configurations_controller.rb

```
class ConfigurationsController < ApplicationController
  def ios_v1
    # ...
  end

  def android_v1
    render json: {
      settings: {},
      rules: [
        # ...
        {
          patterns: [
            "/new$",
            "/edit$"
          ],
          properties: {
            context: "modal",
» pull_to_refresh_enabled: false
          }
        }
      ]
    }
  end
end
```

Remote path configuration is in place. All that’s left is to tell the Android app where it is so Hotwire Native can fetch, parse, and apply the rules.
