What's Next?

This chapter covered how to set up remote path configuration for iOS and Android in order to route forms as modals. As a navigation option that Hotwire Native supports out of the box, modals create better user experiences and make the apps feel more native. And because we kept the logic and configuration on the server, our app is now more resilient to future changes and easier to maintain. But routing forms as modals is the tip of the iceberg. Remote path configuration can be used to route a whole lot more, like native screens powered by SwiftUI in Chapter 5, *Render Native Screens with SwiftUI*, and Jetpack Compose in Chapter 6, *Render Native Screens with Jetpack Compose*.

We still have a problem to resolve with our apps. Remember when we hid the web-based navigation bar in Chapter 2, *Control Your Apps with Rails*? That had important links to the "Hikes" and "Hikers" pages. And right now, users of the apps can't access them. Now that you've learned how path configuration can route different pages to different behaviors, you're ready to explore adding native tabs to your apps—a common navigation pattern on native iOS and Android apps.
