

This chapter covers how to add tabs to your Hotwire Native apps. You'll clean up your iOS and Android directories to prepare for tabs and then configure a tab for each link in the navigation bar.

As before, you'll first build the feature on iOS and then move over to Android.

But before we dive in, let's clean up our workspace a bit. You're going to be adding a few new files to the project in this chapter, so let's make sure everything has its own space.
