```
        url: baseURL.appending(path: "hikes")
    )

    private let hikersTab = HotwireTab(
        title: "Hikers",
        image: UIImage(systemName: "figure.hiking")!,
        url: baseURL.appending(path: "users")
    )

» extension HotwireTab {
»     static let all = [
»         hikesTab,
»         hikersTab
»     ]
» }
```

Our model is complete—we'll use these tabs to populate a tab bar controller.

Migrate from Navigator to HotwireTabBarController

Open SceneDelegate and replace the Navigator property with a HotwireTabBarController.

ch04_04/ios/App/Delegates/SceneDelegate.swift

```
    import HotwireNative
    import UIKit

    let baseURL = URL(string: "http://localhost:3000")!

    class SceneDelegate: UIResponder, UIWindowSceneDelegate {
        var window: UIWindow?

»       private let tabBarController = HotwireTabBarController()

        func scene(
            _ scene: UIScene,
            willConnectTo session: UISceneSession,
            options connectionOptions: UIScene.ConnectionOptions
        ) {
            window?.rootViewController = navigator.rootViewController
            navigator.start()
```
