

The best part about this approach? Adding a *new* tab requires only a few lines of code. For example, if we had a new “Likes” route, we could add a tab for it like this to **Tabs.swift**:

```
    // ...

» private let likesTab = HotwireTab(
»     title: "Likes",
»     image: UIImage(systemName: "hand.thumbsup")!,
»     url: baseURL.appending(path: "likes")
» )

    extension HotwireTab {
        static let all = [
            hikesTab,
            hikersTab,
»           likesTab
        ]
    }
```
