Configure Tabs on Android

With your Android directories in good shape, you can now configure the tabs. Here's how:

1. Update the layout XML for tabs.
2. Manage tabs with a model.
3. Initialize the tab bar.

Update the Layout XML for Tabs

Start by opening `activity_main.xml`. Here's a reminder of what that file looks like now:

ch04_07/android/app/src/main/res/layout/activity_main.xml

```
<?xml version="1.0" encoding="utf-8"?>
<androidx.fragment.app.FragmentContainerView
    xmlns:android="http://schemas.android.com/apk/res/android"
    xmlns:app="http://schemas.android.com/apk/res-auto"
    android:id="@+id/main"
    android:name="dev.hotwire.navigation.navigator.NavigatorHost"
    android:layout_width="match_parent"
    android:layout_height="match_parent"
    app:defaultNavHost="false" />
```

The layout renders a single node, a `FragmentContainerView`, for the web view. We need to render two web views (one for each tab) and the tab bar. But XML documents can only be comprised of a single root node.

Wrap the existing node in a `ConstraintLayout` element. This allows multiple child elements and gives us more control over how much height each node takes up on the screen.

ch04_08/android/app/src/main/res/layout/activity_main.xml

```
<?xml version="1.0" encoding="utf-8"?>
<androidx.constraintlayout.widget.ConstraintLayout
```
