A heads up that in Kotlin, (almost) every new reference needs to be explicitly imported. But you don't need to do this manually. Let's say you forgot to import `R` in the previous code snippet. Hover over the red `R` and press ⌥ ↩, and then ↩ again to have Android Studio add the `import` statement for you, as shown in the screenshot.

Moving forward, I won't mention any `import` statements. But I'll highlight any changes in the code snippets with arrows to make sure you don't forget them.

Android tab modeling is complete! Let's get the tabs on the screen.
