Wrap everything up by using your tabs model to determine the navigator configurations. Replace the implementation of `navigatorConfigurations()` with `mainTabs.navigatorConfigurations()`. With this handy helper, Hotwire Native extends lists comprised of `HotwireBottomTab` instances, converting tabs to configurations.

ch04_16/android/app/src/main/java/com/masilotti/hikingjournal/activities/MainActivity.kt

```
    // ...
    import dev.hotwire.navigation.activities.HotwireActivity
    import dev.hotwire.navigation.tabs.HotwireBottomNavigationController
»   import dev.hotwire.navigation.tabs.navigatorConfigurations
    import dev.hotwire.navigation.util.applyDefaultImeWindowInsets

    const val baseURL = "http://10.0.2.2:3000"

    class MainActivity : HotwireActivity() {
        private lateinit var bottomNavigationController:
                HotwireBottomNavigationController

        override fun onCreate(savedInstanceState: Bundle?) {
            // ...
        }

»       override fun navigatorConfigurations() = mainTabs.navigatorConfigurations

        private fun initializeBottomTabs() {
            // ...
        }
    }
```

Run the app. You've got tabs!
