When to Go Native

Going with a *native home screen* means the app can launch quickly and offer the highest fidelity possible right away. HEY and Basecamp both have fully native home screens, launching directly to SwiftUI or Jetpack Compose views. (Bonus: They cache the data for offline access, further speeding up launch times.)

37signals uses a native screen for each of the five tabs in their popular Basecamp app, as shown in the following image. These two iOS screens are fully native, not a single web-rendered element in sight!

Native maps offer a better user experience than web-based solutions, as well. Gestures like swiping, pinching, and panning work as expected. And you can fill the entire screen with map tiles and tack on individual features as needed, like pins, overlays, or directions, as shown in the two screenshots.
