Render a Map with a SwiftUI View

Your first step in upgrading the web-based map screen is to create a new SwiftUI view. Create a new folder under `App` named Views, and then create a new file. As the template for your new file, select SwiftUI View from the User Interface section. Name the file MapView.

When the new file opens, you're presented with a new interface on the far right. This is the *Canvas Editor*, showing a SwiftUI preview pane. You can toggle between the right and left panes by clicking the Editor menu and then Assistant or by pressing ⌘⌥↩.

Launch the preview by clicking the Editor menu item, then Canvas, and then Refresh Canvas or ⌘⌥P. You'll see the view rendered on the right, as shown in the screenshot.
