

The SwiftUI view renders whatever is inside the `body` property. Here, it is a `Text()` element saying “Hello, World!” Change the text and watch as the live preview updates automatically. Although this is a sign that your app is building successfully, you might need to refresh the canvas to get it started.

Anything inside that `#Preview` macro at the bottom gets rendered on the right, right now an instance of the new view you created, `MapView`.

At the top of the file, import the MapKit framework and replace the contents of `body` with a `Map`.

ch05_01/ios/App/Views/MapView.swift

```
» import MapKit
  import SwiftUI

  struct MapView: View {
      var body: some View {
»         Map {
»         }
      }
  }

  #Preview {
      MapView()
```
