```
    }
```

Inside of `Map`, create a coordinate and pass it to a new `Marker` class. Here, I'm using the name and rough location of a local hike near where I live in Portland, OR—the beautiful Mount Tabor.

ch05_02/ios/App/Views/MapView.swift

```
    struct MapView: View {
        var body: some View {
            Map {
»               let coordinate = CLLocationCoordinate2D(
»                   latitude: 45.511881,
»                   longitude: -122.595706
»               )
»               Marker("Mount Tabor", coordinate: coordinate)
            }
        }
    }
```

We can't directly render a SwiftUI view in the app just yet. We first need to wrap it in a view controller.
