Wrap up the routing by assigning `self` to the navigator delegate of the `HotwireTabBarController` instance. We also need to change `let` to `lazy var` since this now depends on `SceneDelegate` being created via the reference to `self`, just like `lateinit` in *Initialize the Tab Bar*.

ch05_09/ios/App/Delegates/SceneDelegate.swift

```
    import HotwireNative
    import UIKit

    let baseURL = URL(string: "http://localhost:3000")!

    class SceneDelegate: UIResponder, UIWindowSceneDelegate {
        var window: UIWindow?

»       private lazy var tabBarController = HotwireTabBarController(
»           navigatorDelegate: self
        )

        // ...
    }

    extension SceneDelegate: NavigatorDelegate {
        // ...
»   }
```

Run the app and navigate to a hike page. When you tap the Map button, you'll see a native map, as shown in the screenshot.
