Expose a JSON Endpoint for Structured Hike Data

Our native map is now rendering beautifully and routing at the right time. But it still hardcodes the marker's name and coordinate, which isn't useful. Let's change that by dynamically pulling in data based on the hike.

Back in the Rails app, create a new view at `app/views/maps/show.json.jbuilder`. This view will render whenever we hit `/hikes/:id/map.json`. With the help of Jbuilder, we can extract the hike's coordinates in a single line of code:

ch05_10/rails/app/views/maps/show.json.jbuilder

```
json.extract! @hike, :name, :latitude, :longitude
```

Go ahead and visit `http://localhost:3000/hikes/1/map.json` in your browser, and you'll see the following JSON response:

```
{
  "name":"Crystal Springs",
  "latitude":45.479588,
  "longitude":-122.635317
}
```
