The `@Observable` macro binds public properties to the view it's attached to. Changes trigger a redraw of the view, automatically updating the screen with the latest information, all without manually adding any callbacks or hooks.

Add a public, optional `Hike` property:

ch05_14/ios/App/ViewModels/HikeViewModel.swift

```
    import Foundation

    @Observable class HikeViewModel {
»       var hike: Hike?
    }
```

Now, any time the hike changes, the view will automatically be redrawn!

@Observable Macro

The `@Observable` macro is powerful. But note that it requires iOS 17. If you're targeting older versions of iOS, then you'll need to use the `ObservedObject` protocol and `@Published` property wrapper to achieve the same result.

More information on the three properties can be found in Apple's migration guide.[30]

Build the URL to Fetch the JSON

Now, add a private property to hold the URL and, in the initializer, append the JSON path extension:

ch05_15/ios/App/ViewModels/HikeViewModel.swift

```
    import Foundation

    @Observable class HikeViewModel {
        var hike: Hike?
```
