```
»       private let url: URL
»
»       init(url: URL) {
»           self.url = url.appendingPathExtension("json")
»       }
    }
```

You need to append JSON because the original navigation was triggered via the web, to `/hikes/:id/map`. With `.json` at the end, the server will know to serve the Jbuilder view you created earlier.

Fetch the JSON from the Network

Create a new function to fetch the JSON, using the shared `URLSession` to make the network request:

ch05_16/ios/App/ViewModels/HikeViewModel.swift

```
    import Foundation

    @Observable class HikeViewModel {
        var hike: Hike?

        private let url: URL

        init(url: URL) {
            self.url = url.appendingPathExtension("json")
        }

»       func fetchCoordinates() async {
»           do {
»               let (data, _) = try await URLSession.shared.data(from: url)
»           } catch {
»               print("Failed to fetch hike: \(error.localizedDescription)")
»           }
»       }
    }
```

There are a few new concepts going on here, so let's break them down:
