```
            do {
                let (data, _) = try await URLSession.shared.data(from: url)
»               hike = try JSONDecoder().decode(Hike.self, from: data)
            } catch {
                print("Failed to fetch hike: \(error.localizedDescription)")
            }
        }
    }
```

Here, `hike` refers to the property of `HikeViewModel`. Because `HikeViewModel` is an `@Observable` class, updating one of its properties informs SwiftUI to redraw the view—no additional code required.

Render the Dynamic Hike Data in the View

You now have code that fetches dynamic JSON from the server to create an instance of the `Hike` model. But none of these changes are being applied to the view yet. Let's address this.

Back in `MapView.swift`, add a property for the view model:

ch05_18/ios/App/Views/MapView.swift

```
    struct MapView: View {
»       var viewModel: HikeViewModel

        var body: some View {
            Map {
                let coordinate = CLLocationCoordinate2D(
                    latitude: 45.511881,
                    longitude: -122.595706
                )
                Marker("Mount Tabor", coordinate: coordinate)
            }
        }
    }
```

We now have a property without a default value. Every time this view is created, we need to pass in a `HikeViewModel` instance. Address the preview in the same file first:
