

We haven't actually called the `fetchCoordinates()` function from the view model we just created!

Fix this by adding a `task` to the `Map`, like so:

ch05_20/ios/App/Views/MapView.swift

```
    struct MapView: View {
        var viewModel: HikeViewModel

        var body: some View {
            Map {
                if let hike = viewModel.hike {
                    Marker(hike.name, coordinate: hike.coordinate)
                }
            }
»           .task {
```
