Chapter 6

Render Native Screens with Jetpack Compose

In the previous chapter, we covered *when* to upgrade to native screens. Native home screens, native maps, and native API integration are all great candidates for going native. Whereas screens that change frequently, deal with CRUD-like operations, or render lots of dynamic content are better suited for an HTML-based approach. Feel free to review *When to Go Native*, for a refresher.

This chapter focuses entirely on the Android side of things. We'll walk through converting our web-based map screen to one driven by a native Google Maps integration.
