Build a Jetpack Compose Screen

To work with Compose, we need to first update our project's configuration. Android Studio is integrated tightly with editing Compose files, so there are a few steps to make sure everything works.

Configure Compose

First, open `libs.versions.toml` under the `Gradle Scripts` directory and make sure Kotlin is set to 2.0.0 or later. This ensures we don't have to manually check Compose to Kotlin compatibility.[32]

```
  [versions]
  # ...
» kotlin = "2.x.x"
  # ...

  [libraries]
  # ...

  [plugins]
  # ...
```

In the same file, add the Compose Compiler plugin by adding `compose-compiler = { id = "org.jetbrains.kotlin.plugin.compose", version.ref = "kotlin" }` to the very bottom of the file, under the `[plugins]` section. Using `version.ref = "kotlin"` ensures that we always align the plugin's version with our version of Kotlin.

Apply the plugin in the *project's* `build.gradle.kts` (the *first* one under Gradle Scripts).

ch06_05/android/build.gradle.kts

```
  // Top-level build file where you can add configuration options common to
  all
  // sub-projects/modules.
  plugins {
```
