```
        alias(libs.plugins.android.application) apply false
        alias(libs.plugins.kotlin.android) apply false
»       alias(libs.plugins.compose.compiler) apply false
    }
```

Then, open the *app's* `build.gradle.kts` (the *second* one). At the top, apply the plugin.

ch06_06/android/app/build.gradle.kts

```
    plugins {
        alias(libs.plugins.android.application)
        alias(libs.plugins.kotlin.android)
»       alias(libs.plugins.compose.compiler)
    }

    // ...
```

And enable Compose.

ch06_07/android/app/build.gradle.kts

```
    // ...

    android {
        // ...

        kotlinOptions {
            jvmTarget = "17"
        }

»       buildFeatures {
»           compose = true
»       }
    }

    // ...
```

Finally, add the Jetpack Compose dependencies to the bottom of the same file. This mix gives us a nice baseline of UI elements and enables live previews in Android Studio.
