Our Compose code will get a bit lengthy, so we don't want to keep it all inside of `onCreateView()`. Let's extract it to a standalone function at the bottom of the file, decorated with `@Composable`.

ch06_12/android/app/src/main/java/com/masilotti/hikingjournal/fragments/MapFragment.kt

```
    // ...
    import androidx.compose.material3.Text
»   import androidx.compose.runtime.Composable
    import androidx.compose.ui.platform.ComposeView
    // ...

    class MapFragment : HotwireFragment() {
        override fun onCreateView(
            inflater: LayoutInflater,
            container: ViewGroup?,
            savedInstanceState: Bundle?
        ): View {
            val view = inflater.inflate(R.layout.fragment_map, container, false)
            view.findViewById<ComposeView>(R.id.compose_view).apply {
                setContent {
»                   MapView()
                }
            }
            return view
        }
    }

»   @Composable
»   fun MapView() {
»       Text(text = "Hello, World!")
»   }
```

Finally, decorate the new Compose function with `@Preview` to render a live preview in Android Studio.

ch06_13/android/app/src/main/java/com/masilotti/hikingjournal/fragments/MapFragment.kt

```
    // ...
    import androidx.compose.ui.platform.ComposeView
```
