```
» import androidx.compose.ui.tooling.preview.Preview
  import com.masilotti.hikingjournal.R
  import dev.hotwire.navigation.fragments.HotwireFragment

  class MapFragment : HotwireFragment() {
      // ...
  }

» @Preview
  @Composable
  fun MapView() {
      Text(text = "Hello, World!")
  }
```

Click the Split button in the upper right to view the live preview on the right side of the screen. Look at that, Jetpack Compose!

We now have a native screen powered by Jetpack Compose! But…there's no way to actually navigate to it. Up next, we'll expose the fragment to Hotwire Native and route the map URL as we did on iOS.
