connect routes with this fragment. Hotwire Native uses this decoration to know which URIs correspond to which fragments.

ch06_14/android/app/src/main/java/com/masilotti/hikingjournal/fragments/MapFragment.kt

```
    // ...
    import com.masilotti.hikingjournal.R
»   import dev.hotwire.navigation.destinations.HotwireDestinationDeepLink
    import dev.hotwire.navigation.fragments.HotwireFragment

»   @HotwireDestinationDeepLink(uri = "hotwire://fragment/map")
    class MapFragment : HotwireFragment() {
        // ...
    }

    // ...
```

In the Rails app, open `configurations_controller.rb` and add a new entry to the `#android_v1` method. We'll match the same pattern as we did on iOS, all "hike map" paths, to set the `uri` property to what we just added to the fragment.

ch06_14/rails/app/controllers/configurations_controller.rb

```
    class ConfigurationsController < ApplicationController
      def ios_v1
        # ...
      end

      def android_v1
        render json: {
          settings: {},
          rules: [
            # ...
»           {
»             patterns: [
»               "/hikes/[0-9]+/map"
»             ],
»             properties: {
»               uri: "hotwire://fragment/map",
```
