```
»               title: "Map"
»             }
»           }
          ]
        }
      end
    end
```

Now, Hotwire Native knows *where* to send these URL paths: the fragment decorated with the matching `@HotwireDestinationDeepLink`, `MapFragment`.

Excellent! Run the app and click the Map button on any hike. You'll see the cute little "Hello, World!" text snuggled up to the top left of the screen.

Adorable? Yes. Useful? Not so much. Also, where'd the bar at the top of the screen go? How are we supposed to navigate back without a back button? Turns out, `ComposeView` takes over the *entire* screen. We need to manually add back in the toolbar at the top.

Open the layout file for this fragment, `fragment_map.xml`, and add an `AppBarLayout` with a `MaterialToolbar` inside of it. Then constrain the existing `ComposeView` so it sits right below. Also, enable `android:fitsSystemWindows` on the root element to make sure the screen renders below the Android status bar.
