```
            <activity
                android:name=".activities.MainActivity"
                android:exported="true">
                <intent-filter>
                    <action android:name="android.intent.action.MAIN" />

                    <category android:name="android.intent.category.LAUNCHER" />
                </intent-filter>
            </activity>

»           <meta-data
»               android:name="com.google.android.geo.API_KEY"
»               android:value="${MAPS_API_KEY}" />
        </application>

    </manifest>
```

Phew… Lots of configuration to configure Google Maps! Not a lot of fun, I know. Especially when we didn't have to do any of this on iOS. OK, enough complaining—back to the code. Let's get a map on the screen!
