Add a Map to the View

Open `MapFragment.kt` and replace `Text()` with `GoogleMap()`. Sadly, Google Maps doesn't work in the Compose Preview, so go ahead and remove the `@Preview` decoration on the function, too.

ch06_16/android/app/src/main/java/com/masilotti/hikingjournal/fragments/MapFragment.kt

```
    // ...
    import androidx.compose.ui.platform.ComposeView
»   import com.google.maps.android.compose.GoogleMap
    import com.masilotti.hikingjournal.R
    import dev.hotwire.navigation.destinations.HotwireDestinationDeepLink
    import dev.hotwire.navigation.fragments.HotwireFragment

    @HotwireDestinationDeepLink(uri = "hotwire://fragment/map")
    class MapFragment : HotwireFragment() {
        // ...
    }

    @Composable
    fun MapView() {
»       GoogleMap()
    }
```

We'll position the map with a coordinate, just as we did with the SwiftUI view. Wrap a `LatLng` in a call to `rememberCameraPositionState()` to ensure the map doesn't reset when switching between apps.

ch06_17/android/app/src/main/java/com/masilotti/hikingjournal/fragments/MapFragment.kt

```
    // ...
    import androidx.compose.ui.platform.ComposeView
»   import com.google.android.gms.maps.model.CameraPosition
»   import com.google.android.gms.maps.model.LatLng
    import com.google.maps.android.compose.GoogleMap
»   import com.google.maps.android.compose.rememberCameraPositionState
    import com.masilotti.hikingjournal.R
```
