```
    class HikeViewModel(private val url: String) : ViewModel() {
        var hike = mutableStateOf<Hike?>(null)
            private set

        suspend fun fetchCoordinates() {
»           val data = withContext(Dispatchers.IO) {
»               URL(url).readText()
»           }
»           val json = JSONObject(data)
»           hike.value = Hike(
»               name = json.getString("name"),
»               latitude = json.getDouble("latitude"),
»               longitude = json.getDouble("longitude")
»           )
        }
    }
```

Just to be safe, add some rudimentary error handling that prints the stack trace of any exceptions that occur.

ch06_26/android/app/src/main/java/com/masilotti/hikingjournal/viewmodels/HikeViewModel.kt

```
    class HikeViewModel(private val url: String) : ViewModel() {
        var hike = mutableStateOf<Hike?>(null)
            private set

        suspend fun fetchCoordinates() {
»           try {
                val data = withContext(Dispatchers.IO) {
                    URL(url).readText()
                }
                val json = JSONObject(data)
                hike.value = Hike(
                    name = json.getString("name"),
                    latitude = json.getDouble("latitude"),
                    longitude = json.getDouble("longitude")
                )
»           } catch (e: Exception) {
»               e.printStackTrace()
»           }
        }
    }
```
