```
    // ...

    @HotwireDestinationDeepLink(uri = "hotwire://fragment/map")
    class MapFragment : HotwireFragment() {
        // ...
    }

    @Composable
    fun MapView(viewModel: HikeViewModel) {
»       LaunchedEffect(viewModel) {
»           viewModel.fetchCoordinates()
»       }

        val hike = viewModel.hike.value
        if (hike != null) {
            // ...
        }
    }
```

And now you have a dynamic map on Android, as shown in the screenshot. Great work—that was a *lot* of mucking around in Android Studio!
