

Integrating Jetpack Compose with Hotwire Native requires a fair amount of code and a lot of configuration. The good news is that next time you can skip all the setup and jump right into the Kotlin code. You'll create a new `Fragment` that holds your `ComposeView` and `@Composable`. Then, you will register the fragment with Hotwire Native and add `@HotwireDestinationDeepLink` to match the `uri` in your path configuration. To get data, a view model will fetch JSON from your server and populate a model via `mutableStateOf()` and `LaunchedEffect`.
