

Source Code for Bridge Components

The full source code for each of these components can be found in the Hotwire Native iOS[38] and Android[39] repositories under the Demo app directory.

So, what actually *is* a bridge component?

Bridge components are comprised of two complementary sides: the web side and the client side. On the web, you'll work with a special subclass of a Stimulus controller[40] configured with a bit of HTML. And on the client, you'll write Swift (or Kotlin if building an Android app) to interact with native APIs.

Breaking this down, each bridge component requires three building blocks:

1. The HTML markup—where your server configures the component.
