Data Attributes in Rails

In Rails we can write data attributes a few different ways. The following two code snippets both generate the same HTML:

```
<a href="#" data-controller="button" data-foo-bar="baz"
>Click</a>
```

The standard approach is to use a separate `data-*` for each attribute:

```
<%= link_to "Click", "#",
  "data-controller": "button",
  "data-foo-bar": "baz" %>
```

And a second approach is to use a single `data` key pointing to a hash. This way also converts underscores in the keys to dashes, allowing us to use Ruby symbols as keys (instead of `"foo-bar"`).

```
<%= link_to "Click", "#", data: {
  controller: "button",
  foo_bar: "baz"
} %>
```

I prefer the second approach because we can group all of our data attributes in a single hash. I also think it looks a bit cleaner.

Note the double dashes (`--`) when referencing the Stimulus controller. This allows us to namespace our bridge component controllers under the `bridge/` directory, keeping them separate from traditional Stimulus controllers.
